

Cloud Security Engineer (Mid-Level)

Location: Pune, India (Hybrid)

Experience: 2–5 years

Employment Type: Full-time

About Vaultline Security Systems

Vaultline helps regulated enterprises (fintech, healthcare, insurance) secure multi-cloud environments. Our platform continuously scans AWS, GCP, and Azure workloads for misconfigurations, excessive permissions, and compliance drift, and our engineering team builds both the scanning engine and the remediation tooling customers rely on.

Role Summary

We're hiring a Cloud Security Engineer to strengthen our internal security posture and contribute to customer-facing security tooling. You'll work closely with Platform and SRE teams to harden infrastructure, run threat modeling exercises, and respond to incidents. This role reports to the Head of Security Engineering.

Responsibilities

- Design and enforce IAM least-privilege policies across AWS and GCP accounts.
- Build and maintain automated security scanning tools (config drift, secrets exposure, CVE checks) integrated into CI/CD.
- Conduct threat modeling and security reviews for new services before production rollout.
- Lead incident response for security events: triage, containment, root-cause analysis, and postmortems.
- Maintain compliance evidence and controls mapped to SOC 2 / ISO 27001 frameworks.
- Mentor engineers on secure coding practices and run periodic internal security training.

Required Qualifications

- 2–5 years of experience in cloud security, DevSecOps, or infrastructure engineering with a security focus.
- Strong hands-on experience securing AWS and/or GCP environments (IAM, VPC, KMS, security groups).
- Proficiency in Python or Go for building internal security tooling and automation.
- Working knowledge of Terraform and container security (Docker, Kubernetes).
- Familiarity with common vulnerability classes (OWASP Top 10) and secure SDLC practices.
- Experience with SIEM/logging tools and incident response processes.

Preferred (Good to Have)

- Security certifications such as AWS Security Specialty, OSCP, or CKS.
- Experience with SOC 2 / ISO 27001 audits from an engineering (not just compliance) perspective.
- Contributions to open-source security tooling.

What We Offer

Competitive compensation with security certification sponsorship, direct ownership of production security posture, a hybrid work model, and a tight-knit team that treats security as an engineering discipline rather than a checkbox.
