

QA Engineer / SDET (Entry Level)

Location: Hyderabad, India (Onsite)

Experience: 0–1 years

Employment Type: Full-time

About Brambleworks Software

Brambleworks builds scheduling and billing software for mid-size healthcare clinics. Our engineering team ships weekly, and quality engineering is treated as a core part of the development process rather than a final gate — QA engineers work directly alongside developers from design through release.

Role Summary

We're looking for an entry-level QA Engineer / SDET to help build out automated test coverage for our web application and APIs. You'll write and maintain automated tests, investigate bugs, and help shape our testing practices as the team scales. This role reports to the QA Lead.

Responsibilities

- Write and maintain automated UI tests (Selenium/Playwright) and API tests (pytest/Postman) for core product flows.
- Design test cases from product requirements and identify edge cases before release.
- Triage, reproduce, and file detailed bug reports; verify fixes before closure.
- Integrate automated test suites into CI/CD pipelines and monitor test stability.
- Participate in sprint planning and collaborate with developers on testability of new features.
- Perform manual exploratory testing for areas not yet covered by automation.

Required Qualifications

- Bachelor's degree in Computer Science, IT, or related field (final-year students eligible).
- Working knowledge of Python or Java, and basic understanding of OOP concepts.
- Understanding of software testing fundamentals: test case design, functional vs. regression testing, bug lifecycle.
- Familiarity with at least one test automation tool (Selenium, Playwright, Cypress, or similar) from coursework or projects.
- Basic SQL knowledge for data validation.
- Strong attention to detail and clear written communication for bug reports.

Preferred (Good to Have)

- Personal or academic projects involving test automation frameworks.
- Exposure to API testing tools (Postman, REST Assured) and version control (Git).
- Basic familiarity with CI/CD tools such as GitHub Actions or Jenkins.

What We Offer

Structured mentorship from senior QA engineers, hands-on ownership of real test suites, exposure to the full product development lifecycle, and a clear growth path toward SDET or QA Lead roles.

To Apply: Send your resume and GitHub/portfolio link to careers@brambleworks.example
