

Senior Cloud Platform Engineer

Location: Bengaluru, India (Remote-friendly) | Department: Platform Infrastructure | Type: Full-time | Experience: 2-4 years

ABOUT THE ROLE

Nimbus Cloud Technologies builds internal developer platforms that let product teams ship and scale services without owning infrastructure complexity. We are looking for a Senior Cloud Platform Engineer to help design, harden, and operate the multi-cloud foundation that over 40 engineering teams build on top of every day. You will work at the intersection of infrastructure-as-code, container orchestration, and developer experience, with a strong emphasis on reliability and cost efficiency.

KEY RESPONSIBILITIES

- Design and maintain Terraform modules for provisioning multi-account AWS and GCP infrastructure used by 40+ product teams.
- Operate and scale Kubernetes clusters (EKS/GKE) including upgrades, autoscaling policies, and workload isolation.
- Build and maintain CI/CD pipelines (GitHub Actions, ArgoCD) that support GitOps-based deployment workflows.
- Define and enforce IAM, network segmentation, and secrets management policies across cloud accounts.
- Own observability stack (Prometheus, Grafana, OpenTelemetry) and drive SLO-based alerting for platform services.
- Lead incident response for platform-level outages, including postmortems and long-term remediation planning.
- Partner with product engineering teams to reduce infrastructure toil through self-service tooling and internal APIs.
- Continuously evaluate and reduce cloud spend through rightsizing, spot/preemptible usage, and architecture reviews.

MUST-HAVE QUALIFICATIONS

- 2-4 years of experience in cloud infrastructure, platform, DevOps, or SRE roles.
- Hands-on production experience with at least one major cloud provider (AWS, GCP, or Azure).
- Strong working knowledge of Kubernetes: deployments, networking, RBAC, and troubleshooting workloads in production.
- Proficiency with Infrastructure-as-Code tooling, particularly Terraform.
- Solid scripting/programming ability in Go or Python for building internal tooling and automation.
- Experience with CI/CD systems and GitOps-based deployment models.
- Comfortable working with Linux internals, networking fundamentals (DNS, load balancing, TLS), and container runtimes.

NICE TO HAVE

- Experience with service mesh technologies (Istio, Linkerd) or API gateways.
- Exposure to FinOps practices and cloud cost optimization tooling.
- Familiarity with policy-as-code frameworks such as OPA/Gatekeeper.
- Prior experience contributing to open-source infrastructure projects.
- Multi-cloud experience across AWS, GCP, and OCI.

BENEFITS & PERKS

- Fully remote-friendly with quarterly in-person team offsites.
- Learning stipend for certifications (CKA, AWS/GCP professional certs) and conferences.
- Comprehensive health insurance for employee and dependents.
- Flexible working hours with core collaboration hours of 11 AM - 4 PM IST.
- Dedicated 20% time for internal tooling and open-source contributions.
